

FLEX-MAT®

HIGH VIBRATION WIRE SCREEN

FLEX-MAT SENSOR

App-controlled

The simplicity of the system's design ensures valuable and actionable data without the requirement for a plant shutdown to calibrate and install the sensor.

Quick Read-out in two minutes

The app provides a quick read-out for vibration at the four corners of the machine and the deck inclination where applicable.

Within seconds a report is generated, and it can be sent or reviewed.

Basic variables of machine vibration can be assessed instantly: stroke, rpm, g-force, orbit.

Experienced users can identify setup or maintenance issues and may recommend more detailed analysis or specific actions.

Safe storage on our proprietary database

Once you are done taking the measurement and reviewing the results, the app will send the entire check-up to the MAJOR database and an in-depth report will be created and returned to you.

Manage your projects

Users can search, manage and modify all of their measurements online.

Super-users can be set up to manage multiple users of a company.

You can set up as many employees as you would like, to have access and manage the data.

For further information please contact your Customer Service Representative or your Territory Manager.
